PrintStreamDemo.java

```java
class PrintStatements{

        public static void main(String[] args){

                // This does not takes cursor to the next Line ...
                System.out.print("Core 2 web");

                // This takes the cursor to the next line ...
                System.out.println("Core 2 web Again ... ");

                // This concats the num at the end of string instead of adding 10 + 20 = 30
                System.out.println("10" + 20);

                // This adds the values as 10 and 20 both are integers
                System.out.println(10 + 20);

                // Did you know? printf() like function in c is supported in java like follows ...
                System.out.printf("num1 : %d\t num2 : %d\t addition : %d\n", 10, 20 , 10+20);

                // String formatting example ... this is how you can insert int between strings
                System.out.println("John is "+ 20 + " years old and born in " + 1999);
        }
}
~
```
