```java
class India extends Object{

        // constructor
        India(){
                System.out.println("In India ...");
        }
}

class America extends Object{

        // static block
        static{

                System.out.println("In Static America ...");
        }

        // constructor
        America(){

                System.out.println("In America");
        }
}

class Run{

        public static void main(String[] args){

                India cIndia = new India();
                America cAmerica = new America();
        }
}
~
```
